

New Energy supports sustainable waste management practices by providing a viable alternative to landfill. The energy in the waste is extracted and returned to the community, maximising the value of the waste and minimising its environmental impact.

The Process

Sustainable Waste Treatment

Build, own and operate commercially viable Waste-to-Energy plants.

Reduce our environmental impact by diverting waste from landfill.

Waste-to-Energy Plant

Process the waste using state-of-the-art technology.

Use Entech low temperature gasification, an advanced thermal treatment technology, to recover energy from the waste.

Clean Energy Generation

Generate renewable energy to supply back to the grid or directly to industry.

Maximise the benefits of this clean technology by returning the energy to households and local industry.
